A Lagos shop can burn ₦25,000 of petrol a week, and buying solar is guesswork

Who: small shops and workshops that run a petrol generator when the grid fails

What fails: systems too small (flat before midnight) or too big (money never returns)

Why: buyers have no neutral, location-based way to check a quote

Describe what you power. Get the right system for your city.

The example shop avoids 3 tonnes of CO_2 and saves ₦1.3M a year

1,300 L	**3.0 t**	**₦4.07M**
petrol not burned a year	CO_2 avoided a year	kept over 5 years, after the system

Modelled for the example shop: ₦25,000 of petrol a week at ₦1,000 a litre, assuming solar replaces all generator petrol. Prices are placeholders. Next evidence: compare results with real installer quotes.

Before Oct 30: the working app (tag prior-work-2026-10-29). **During the sprint:** security upgrade, public deployment, live-site testing, submission package.

Free for shops. Installers and pay-as-you-go firms pay per request.

Unit cost (example shop)

₦2.43M system, payback about 23 months.

Or ₦243,000 down, then ₦115,629 a month for 24 months (example terms).

Petrol today: ₦108,333 a month.
Affordability for the lowest-income users depends on real provider terms.

6 to 18 months

0–6: sourced prices, pilot with 50 shops

6–12: one pay-as-you-go partner paying per lead

12–18: nationwide, monthly price updates

A new country needs a city list, a price table and a currency

Scale: sizing maths and NASA data work worldwide. Kenya and Ghana next

Biggest risk: wrong prices. Test against real quotes, then monthly partner updates

Team lead: Mgbokinyi Chidubem Emmanuel, Awka, Nigeria

Need next: one installer partner, one pay-as-you-go partner, pilot coaching
